

Phishing Email Analysis Report

Subject:	Account Suspension Notice
Sender:	Outlook Support <luichang@webberit.us>
Verdict:	PHISHING — Malicious / Credential Harvesting & Malware Delivery

Sample Raw Header (excerpt)

```
Received: from app.webberit.us (89.47.165.109) by mx.example.com with ESMTP;  
Date: Mon, 13 Oct 2025 09:12:03 +0000  
From: "Outlook Support"  
Reply-To: support@webberit.us  
Return-Path:  
Received-SPF: pass (mx.example.com: domain of webberit.us designates 89.47.165.109 as  
permitted sender)  
DKIM-Signature: v=1; a=rsa-sha256; d=webberit.us; s=default; ...  
Message-ID: <12345.app.webberit.us@example.com>
```

Findings

Spoofed sender: Display name claims Microsoft/Outlook while the envelope From domain is webberit.us (not Microsoft).

Header discrepancies: Received chain shows origin from app.webberit.us (89.47.165.109) rather than Microsoft infrastructure. Timestamps and hops are inconsistent.

SPF / DKIM nuance: SPF and DKIM validate for webberit.us — this only proves authorization for that domain, not legitimacy of the displayed brand.

Suspicious links: 'Verify your account' button points to <http://secure-outlook-login.webberit.us/login> (mismatch vs visible Microsoft URL).

Attachment: Malicious file named Security_Update.zip — common malware delivery vector.

Urgent language: Threats of immediate suspension within 24 hours to force quick action.

Spelling/visual clues: Minor grammar mistakes; low-resolution Microsoft logo (stretched).

Executive Summary

This message is a phishing attempt. The attacker used an attacker-controlled domain (webberit.us) to send email while impersonating Microsoft in the display name. Links and attachments are designed to capture credentials or deliver malware. Headers confirm inconsistent routing and cryptographic checks validate the attacker's domain, not the impersonated brand.

Recommended Actions (concise)

- Do not click links or open attachments from this email.
- Preserve raw headers and report to security/IT.
- If credentials were submitted, change passwords from a clean device and enable MFA.
- Block sender domain and add indicators to email gateway rules.
